From diagnostics to in vivo-research

Quarantine

We offer the services of our quarantine station to test the health of your own or animals you are importing, without putting your facilities at risk. The availability of disease and pathogen free laboratory animals is critical to laboratory services. Disease control and welfare issues require particular housing arrangements, attention and continued monitoring. In case of suspected sickness we will keep your animals in quarantine.

Upon arrival at our site animals will be checked for health via blood, fur and feces samples and anal and throat swabs. If analysis shows good health the animals are returned to you immediately. If they have any kind of illness they will be sanitized via medication or in difficult cases via embryo transfer or burn-out.

Once health of the animals is recovered we will issue a health certificate and return them to you.

Our quarantine station is featuring optimal conditions for laboratory animals. Upon arrival of newcomers the outside of the shipping container will be decontaminated and the rodents removed and housed in filter top cages. Cages are opened only under the HEPA-filtered hood present in the quarantine room. Protective clothing is required for anyone entering the quarantine room.

Safeguard your laboratory animals from health risks through infection.

Spare yourself the setting up of a quarantine station and a team of medical specialists. You get full service around quarantine from us.

Information on quarantine standard operating procedures, including treatments and diagnostic testing, is available for review.
